Quiz 4, 20 October 2015

The complete wavefunction of an atomic orbital of hydrogen is given below:

$$\psi(r, \theta, \phi) = \frac{2}{81\sqrt{3}} \left(\frac{1}{4\pi}\right)^{1/2} \left(\frac{Z}{a_0}\right)^{3/2} (27 - 18\sigma + 2\sigma^2) \exp\left(\frac{-\sigma}{3}\right)$$

where $\sigma = \frac{Zr}{a_0}$

- How many radial, angular, and total nodes does this orbital have?
- What are the values of n , l , and m for this orbital?
- Draw and name the orbital.
- Extra credit (not much): what values of r give a radial node?

The following information may be useful:

$$q = 1.602 \times 10^{-19} \text{ C}$$

$$\epsilon_0 = 8.854 \times 10^{-12} \text{ C}^2 \text{ J}^{-1} \text{ m}^{-1}$$

$$m_e = 9.11 \times 10^{-31} \text{ kg}$$

$$h = 6.626 \times 10^{-34} \text{ J s}$$

$$c = 3.0 \times 10^8 \text{ m s}^{-1}$$

$$a_0 = 0.529 \times 10^{-10} \text{ m}$$

a) θ and ϕ do not appear in the wavefunction, so this orbital does not have any angular nodes. By inspection, $\psi = 0$ when $\sigma = \text{large}$ (i.e. high value of r), \rightarrow

Quiz 4 Key continue

and when $(27 - 18\sigma + 2\sigma^2) = 0$. Even if you cannot solve this polynomial easily, you should see by inspection that it is 0 in two places. Therefore, this wave function has two radial nodes.

$$\text{Total nodes} = \text{radial nodes} + \text{angular nodes} = 2 + 0 = 2$$

b) From part a): $n = \text{total nodes} + 1 = 3$

$$l = \text{angular nodes} = 0$$

$$m = 0$$

c) This is a 3s orbital:

$$d) 27 - 18\sigma + 2\sigma^2 = 0$$

$$13.5 - 9\sigma + \sigma^2 = 0$$

$$-9\sigma + \sigma^2 = -13.5$$

add $(\frac{9}{2})^2$ to both sides:

$$20.25 - 9\sigma + \sigma^2 = 6.75$$

factor:

$$(\sigma - 4.5)^2 = 6.75$$

$$\sigma - 4.5 = \pm 2.598$$

$$\textcircled{1} \sigma - 4.5 = 2.598$$

$$\sigma = 7.098 = \frac{(1)r}{a_0}$$

$$\boxed{r = 7.1a_0}$$

$$\textcircled{2} \sigma - 4.5 = -2.598$$

$$\sigma = 1.9 = \frac{(1)r}{a_0}$$

$$\boxed{\sigma = 1.9a_0}$$
